

FAQs – Commercial Production of Biopolymers

Last updated December 9, 2025

Can the product come in a water-soluble powder that can be reconstituted to meet the 10,000-gal request? How many acres are you trying to treat? Can you apply with a product that takes a more comprehensive approach to soil health and stabilization? How many delivery locations for this project?

The water-soluble powder is an acceptable form for the Government. The Government is looking for more commercial availability, seeing the current knowledge level and ability to manufacture this technology on a large scale. This RFI is not based on the need of one specific project, but with the idea that USACE can leverage this technology at large. The Government felt 10,000 gallons was a sufficient number needed to meet the goal of upscaling.
